# **CTD/O<sub>2</sub>, LADCP, and XBT measurements collected aboard the R/V SEWARD JOHNSON, February-March 1999: North Brazil Current Rings Experiment Cruise 2 (NBC-2)**

C. Fleurant,<sup>1</sup> D. Wilson,<sup>2</sup> W. Johns,<sup>3</sup> S. Garzoli,<sup>2</sup> R. Smith,<sup>1</sup> D. Fratantoni,<sup>4</sup> P. Richardson,<sup>4</sup> G. Goni,<sup>2</sup>

**Abstract.** Summaries of Conductivity-Temperature-Depth (CTD/O<sub>2</sub>), Lowered Acoustic Doppler Current Profiler (LADCP), and Expendable Bathythermograph (XBT) measurements and hydrographic data acquired on an oceanographic research cruise during the winter of 1999 aboard the Harbor Branch Oceanographic Institution ship *R/V SEWARD JOHNSON* are presented. Data acquisition and processing systems are described, and calibration procedures are documented. Station location, CTD/O<sub>2</sub>, LADCP, XBT summary data listings, and profiles are included for each station.

## **1. Introduction**

North Brazil Current rings are large (400 km diameter) anticyclones that pinch off from the North Brazil Current (NBC) retroreflection in the western tropical Atlantic near 8°N, translate northwestward along the coast of South America, and decay through topographic interaction near the passages of the southeastern Caribbean. Advection within translating NBC rings has been proposed as one of several important pathways for the transport of South Atlantic upper-ocean water across the equatorial-tropical gyre boundary and into the North Atlantic subtropical gyre. Such transport is required to complete the Meridional Overturning Cell (MOC) in the Atlantic forced by the high-latitude production and southward export of North Atlantic Deep Water.

The mechanisms which contribute to NBC ring formation, and the structure and dynamics of the rings themselves, are not well understood. The specific objectives of the cruise are to:

1. Obtain a thorough description of the spatial and temporal evolution of the North Brazil Current retroreflection and the separation of rings from the retroreflection;
2. Determine the physical structure of the rings after separation from the NBC, including their sizes, vertical structure, horizontal swirl velocities, and the volume of South Atlantic water they trap and transport; and
3. Determine the rates of translation, decay, and mixing with resident North Atlantic waters as the rings move northwestward from their generation point toward the Caribbean Sea.

To accomplish these objectives, several complementary measurement techniques were employed during a previous cruise (NBC-1). Primary elements of the observing strategy included: (1) an Inverted Echo Sounder (IES) array placed within TOPEX/GEOSAT-2 track lines to optimally monitor the evolution of the NBC retroreflection and ring generation events; (2) moored current and temperature-salinity measurements along the ring translation corridor to determine the transport and water mass characteristics of the rings; (3) detailed shipboard CTD/ADCP surveys and (4) deployments of surface drifters and subsurface RAFOS floats in selected rings to track their propagation and decay at various stages of their life cycle. This report describes the CTD/LADCP survey data and additional XBT profile data collected during the second cruise of this project (NBC-2), which took place from February 6 to March 9, 1999 aboard the *SEWARD JOHNSON*.

A total of 81 hydrographic stations were occupied during two legs of this cruise. Figure 1 shows station locations for legs 1 and 2. Table 1 provides a summary of CTD/LADCP cast information. At each station, profiles of temperature, salinity (conductivity) and dissolved oxygen concentration were collected to a depth of 2000 m or to within approximately 10 m of the bottom at shallower depths. LADCP measurements were taken concurrently with CTD/O<sub>2</sub> stations. Water samples for calibration of the salinity and dissolved oxygen profiles were collected at each station.

## 2. Standards and Pre-Cruise Calibrations

The CTD/O<sub>2</sub> system is a real-time data acquisition system with the data from a Sea Bird Electronics, Inc. (SBE) 9plus underwater unit transmitted via a conducting cable to a SBE 11plus deck unit. The serial data from the underwater unit is sent to the deck unit in RS-232 NRZ format. The deck unit decodes the serial data and sends it to a personal computer for display and storage in a disk file using Sea-Bird SEASOFT software.

The SBE 911plus system transmits data from primary and auxiliary sensors in the form of binary numbers equivalent to the frequency or voltage outputs from those sensors. These are referred to as the raw data. The SBE software performs the calculations required to convert raw data to engineering units.

The SBE 911plus system is electrically and mechanically compatible with the standard, unmodified carousel water sampler, also made by Sea-Bird Electronics, Inc. A modem and carousel interface allows the 911plus system to control the operations of the carousel directly without interrupting the flow of data from the CTD.

The SBE 9plus underwater unit is configured with dual standard modular temperature (SBE 3) and conductivity (SBE 4) sensors, which are mounted near the lower end cap. The conductivity cell entrance is co-planar with the tip of the temperature sensor probe. The pressure sensor is mounted inside the underwater unit main housing. A centrifugal pump module flushes water through sensor tubing at a constant rate independent of the CTD's motion to improve dynamic performance. Dual dissolved oxygen sensors are added to the pumped sensor configuration following the temperature-conductivity (TC) pair.

### 2.1 Conductivity

The flow-through conductivity-sensing element is a glass tube (cell) with three platinum electrodes. The resistance measured between the center electrode and the end electrode pair is determined by the cell geometry and the specific conductance of the fluid within the cell, and controls the output frequency of a Wein Bridge circuit. The sensor has a frequency output of approximately 3 to 12kHz corresponding to conductivity from 0 to 7 Siemens/meter (0 to 70 mmho/cm). The SBE 4 has a typical accuracy/stability of  $\pm 0.0003$  S/m and resolution of 0.00004 S/m at 24 scans per second.

Two conductivity sensors were used during NBC-2 (serial numbers 1374 and 1387). Pre-cruise sensor calibrations were performed at Sea-Bird Electronics, Inc. in Bellevue, Washington. The following coefficients were entered into SEASOFT using the software module SEACON:

s/n 1374	s/n 1387
<u>January 19, 1999</u>	<u>January 19, 1999</u>
<i>g</i> = -4.27388542e+00	<i>g</i> = -4.05073805e+00
<i>h</i> = 5.21836847e-01	<i>h</i> = 4.61157764e-01
<i>i</i> = -1.53707669e-04	<i>i</i> = -6.92975591e-05
<i>j</i> = 3.71920371e-05	<i>j</i> = 2.68244316e-05
<i>ctcor</i> = 3.2500e-06	<i>ctcor</i> = 3.2500e-06
<i>cpcor</i> = -9.5700e-08	<i>cpcor</i> = -9.5700e-08

Conductivity calibration certificates show an equation containing the appropriate pressure-dependent correction term to account for the effect of hydrostatic loading (pressure) on the conductivity cell:

$$C \text{ (S/m)} = (g + h f^2 + i f^3 + j f^4) / [10 (1 + cctcor * t + cpcor * p)]$$

where  $g$ ,  $h$ ,  $i$ ,  $j$ ,  $cctcor$ , and  $cpcor$  are the calibration coefficients shown above,  $f$  is the instrument frequency (kHz),  $t$  is the water temperature (degrees Celsius), and  $p$  is the water pressure (dbar). SEASOFT automatically implements this equation.

## 2.2 Temperature

The temperature-sensing element is a glass-coated thermistor bead, pressure protected by a stainless steel tube. The sensor output frequency ranges from 5-13 kHz, corresponding to temperatures ranging from -5 to 35°C. The output frequency is inversely proportional to the square root of the thermistor resistance, which controls the output of a patented Wein Bridge circuit. The thermistor resistance is exponentially related to temperature. The SBE 3 thermometer has a typical accuracy/stability of  $\pm 0.004^\circ\text{C}$  per year and a resolution of  $0.0003^\circ\text{C}$  at 24 samples per second. The SBE 3 thermometer has a fast response time of 0.070 seconds.

The two temperature sensors used during NBC-2 were s/n 1701 and 1075. Pre-cruise sensor calibrations were performed at Sea-Bird Electronics, Inc. in Bellevue, Washington. The following coefficients were entered into SEASOFT using SEACON:

s/n 1701	s/n 1075
<u>January 12, 1999</u>	<u>January 12, 1999</u>
$g = 4.78995715e-03$	$g = 4.81081561e-03$
$h = 6.52955449e-04$	$h = 6.68763171e-04$
$i = 1.80809061e-05$	$i = 2.50451194e-05$
$j = 9.48099234e-07$	$j = 1.97005533e-06$
$f_0 = 1000.0$	$f_0 = 1000.0$

Temperature (ITS-90) is computed according to

$$T [\text{ }^\circ\text{C}] = [1 / (g + h \ln(f_0/f) + i \ln^2(f_0/f) + j \ln^3(f_0/f))] - 273.15$$

where  $g$ ,  $h$ ,  $i$ ,  $j$  and  $f_0$  are the calibration coefficients above and  $f$  is the instrument frequency (Hz). SEASOFT automatically implements this equation and converts between ITS-90 and IPTS-68 temperature scales as desired.

## 2.3 Pressure

The Paroscientific series 4000 Digiquartz high pressure transducer uses a quartz crystal resonator whose frequency of oscillation varies with pressure induced stress, measuring changes in pressure as small as 0.01 parts per million with an absolute range of 0 to 10,000 psia (0 to 6885 dbar). Repeatability, hysteresis, and pressure conformance are 0.002% FS. The nominal pressure frequency (0 to full scale) is 34 to 38 kHz. The nominal temperature frequency is 172 kHz + 50 ppm/°C.

The pressure sensor utilized during NBC-2 was s/n 58808. Pre-cruise sensor calibrations were performed at Sea-Bird Electronics, Inc. in Bellevue, Washington. The following coefficients were entered into SEASOFT using the module SEACON:

s/n 58808  
May 31, 1996  
 c1 = -4.53844e+04  
 c2 = -1.963440e-01  
 c3 = 1.278040e-02  
 d1 = 3.779600e-02  
 d2 = 0  
 t1 = 3.010293e+01  
 t2 = -2.932600e-04  
 t3 = 3.610820e-06  
 t4 = 3.748630e-09

Pressure coefficients are first formulated into

$$\begin{aligned}
 c &= c_1 + c_2 U + c_3 U^2 \\
 d &= d_1 + d_2 U \\
 t0 &= t1 + t2 * U + t3 * U^2 + t4 * U^3
 \end{aligned}$$

where  $U$  is temperature in degrees Celsius. Pressure is computed according to

$$P(\text{psia}) = c (1 - (t0^2/t^2)) (1 - d (1 - (t0^2/t^2)))$$

where  $t$  is pressure period ( $\mu\text{s}$ ). SEASOFT automatically implements this equation.

## 2.4 Oxygen

The SBE 13Y dissolved oxygen sensor (Yellow Springs Instrument (YSI)) uses a polarographic type element. Oxygen sensors determine the dissolved oxygen concentration by counting the number of oxygen molecules per second (flux) that diffuse through a membrane. By knowing the flux of oxygen and the geometry of the diffusion path, the concentration of oxygen can be computed. The permeability of the membrane to oxygen is a function of temperature and ambient pressure. The interface electronics output voltages are proportional to membrane current (oxygen current) and membrane temperature (oxygen temperature). Oxygen temperature is used for internal temperature compensation. Initial computation of dissolved oxygen in engineering units is done in the software. The range for dissolved oxygen is 0 to  $670\mu\text{mol/kg}$ ; nominal accuracy is  $4.45\mu\text{mol/kg}$ ; resolution is  $0.4\mu\text{mol/kg}$ . Response times are roughly 2 seconds at  $25^\circ\text{C}$  and 5 seconds at  $0^\circ\text{C}$ .

Oxygen sensors 130433 and 230531 were used during NBC-2. The following oxygen calibrations were entered into SEASOFT using SEACON:

s/n 130433	s/n 230531
<u>September 9, 1998</u>	<u>August 31, 1998</u>
$m = 1.0048e-5$	$m = 1.0059e-5$
$b = -4.8229e-9$	$b = -1.6094e-8$
$soc = .0785$	$soc = 0.0887$
$boc = -.0083$	$boc = -0.0209$
$tcor = -.033$	$tcor = -0.033$
$pcor = 1.50e-4$	$pcor = 1.50-e4$
$tau = 2.0$	$tau = 2.0$
$wt = 0.85$	$wt = .85$
$k = 6.5742$	$k = 6.5121$
$c = -1.4886$	$c = -1.7991$

The use of these constants in linear equations of the form  $I = mV + b$  and  $T = kV + c$  yield sensor membrane current and temperature (with maximum error of about  $0.5^{\circ}\text{C}$ ) as a function of sensor output voltage.

### 3. Data Acquisition

CTD/O<sub>2</sub> measurements were made using a SBE 9plus CTD with dual sensor configuration. Each set of sensors included a temperature, conductivity, and dissolved oxygen sensor. The sets were placed as mirror images to each other mounted low in the CTD main housing with the intakes approximately 6-8 inches apart. The TC pairs were monitored for calibration drift and shifts by examining the differences between the two pairs on each CTD and comparing CTD salinity values with bottle salinity measurements.

AOML's SBE 9plus CTD/O<sub>2</sub> s/n 09P10779-0363 (sampling rate 24Hz) was mounted in a 24-position frame and employed as the primary package. Auxiliary sensors included a lowered acoustic doppler current profiler (LADCP) and a Simrad altimeter. Water samples were collected using a SBE bottle carousel and 10-liter Niskin bottles. Data from the primary sensor package was used for all final data in this report.

The package entered the water from the starboard side of the ship and was held within 5 meters of the surface for 1 minute in order to activate the pump. The package was lowered at a rate of 30 m/min to 100 m and 60 m/min generally to within 10 meters of the bottom, slowing on the approach. The altimeter monitored the position of the package relative to the bottom.

Upon completion of the cast, sensors were flushed repeatedly and stored with a dilute Triton-X solution in the plumbing. Niskin bottles were then sampled for oxygen and salinity.

A SBE 11plus deck unit received the data signal from the CTD. Digitized data were forwarded to a personal computer equipped with SEASOFT acquisition and processing software version 4.234. Preliminary temperature, salinity, and oxygen profiles were displayed in real time. Raw data files were archived to SyQuest 230mb removable drives.

#### 3.1 Data Acquisition/System Problems

Data acquisition problems incurred during the cruise were due to data flow interruption to the carousel. No bottle data was sacrificed due to the data interruption; therefore all data for this cruise are complete. The performance of the temperature and conductivity sensors was outstanding. The performance of oxygen sensor 230531 began to deteriorate after station 052 due to a defective sensor membrane. Oxygen data from station 053 through station 081 are from oxygen sensor 130433.

#### 3.2 Salinity Analyses

Bottle salinity analyses were performed in the ship's temperature-controlled salinity laboratory using a Guildline Model 8400B inductive autosalinometer, and a dedicated PC. Software allowed the user to standardize the autosal and perform a second standardization using a fresher standard (30 PSS) for a linearity check. IAPSO Standard Seawater was used as the standard. The autosal was standardized before each case of 24 samples was analyzed. The software limits set required that each successive reading be within  $\pm 0.002$  PSS or the program would reject that reading and seek another. Stable room temperature and high performance of the autosalinometer allowed these limits to be strictly set.

Duplicate samples were taken from the deepest bottle on several casts. Bottle salinities were compared with preliminary CTD salinity values to monitor CTD conductivity cell performance and drift. The expected precision of the autosal was 0.001 PSS, with an accuracy of  $\pm 0.0003$  PSS.

### **3.3 Oxygen Analyses**

Bottle oxygen analyses were also performed in the ship's temperature-controlled salinity laboratory using a photometric automatic Winkler method titrator with a Carpenter modification, and a dedicated PC. The water samples were drawn (without air bubbles) from Niskin bottles immediately upon arrival on deck. Manganese sulfate (or chloride) was added to the sample, followed by the addition of an alkaline sodium hydroxide-sodium iodide solution. These solutions "pickled" the sample, causing it to precipitate and react with the dissolved oxygen in the water sample. The sample was then dissolved and photometrically titrated to an end point with a standardized sodium thiosulphate solution. The content of oxygen value was calculated utilizing the volume of the water sample bottle and the amount of added thiosulphate. Automated titrating systems can attain a precision of about  $\pm 4.46 \mu\text{mol/kg}$  (Friederich *et al.*, 1991).

## **4. At Sea Processing of CTD Data**

SEASOFT consists of modular menu-driven routines for acquisition, display, processing, and archiving of oceanographic data acquired with SBE equipment. The software is designed to work with a PC. Raw data are acquired from the instruments and are stored in an unmodified format. The conversion module DATCNV uses the instrument configuration and pre-cruise factory calibration coefficients to create a converted engineering unit data file that is utilized by all SEASOFT post processing modules. Unless otherwise noted, all calibration parameters given are factory default values recommended by Sea Bird Electronics, Inc. The following is the SEASOFT processing module sequence and specifications used in the reduction of CTD/O<sub>2</sub> data from this cruise:

- DATCNV converted the raw data to pressure, temperature, conductivity, oxygen current, and oxygen temperature, and computed salinity, the time rate of change of oxygen current, and preliminary oxygen. DATCNV also extracted bottle information where scans were marked with a bottle confirmation bit during acquisition.
- ROSSUM created a summary of the bottle data. Bottle position, date, and time were output automatically. Pressure, temperature, conductivity, salinity, oxygen current, oxygen temperature, time rate of change of oxygen current, and preliminary oxygen values were averaged over a 2 second interval from 5 to 3 seconds prior to the confirm bit. ROSSUM computed potential temperature and sigma-theta.
- WILDEDIT marked extreme outliers in the data files. The first pass of WILDEDIT obtained an accurate estimate of the true standard deviation of the data. The data were read in blocks of 200 scans. Data greater than two standard deviations were flagged. The second pass computed a standard deviation over the same 200 scans excluding the flagged values. Values greater than 16 standard deviations were marked as bad values.
- SPLIT grouped data into up cast (pressure decreasing) and down cast (pressure increasing) files.
- FILTER performed a low-pass filter on pressure data with a time constant of 0.15 seconds. In order to produce no time shift, the filter first ran forward and then backwards through the data file.
- ALIGNCTD aligned conductivity, temperature, and oxygen in time relative to pressure to ensure that all calculations were made using measurements from the same parcel of water, which minimized salinity spiking and density errors. The SBE 11plus deck unit has factory settings to advance the primary conductivity cell; therefore, ALIGNCTD was not performed on this cell. The secondary conductivity cell, however, is not advanced in the deck unit and so was advanced 0.073 seconds in the ALIGNCTD module. Since the SBE3 temperature sensor response is fast, (0.06 seconds), it was unnecessary to advance temperature relative to pressure. Oxygen sensors s/n 130433 and s/n 230531 were advanced 3 seconds in ALIGNCTD.

- CELLTM used a recursive filter to remove conductivity cell thermal mass effects from measured conductivity. Both conductivity cells were epoxy coated; the thermal anomaly amplitude (alpha) and time constant (1/beta) were 0.03 and 9.0, respectively for each sensor.
- DERIVE was used to re-compute the time rate of change of oxygen current ( $\text{dox}/\text{dt}$ ) and oxygen ( $\mu\text{mol}/\text{kg}$ ) with a time window size of 2 seconds.
- LOOPEDIT marked data scans where the CTD package was moving less than a minimum velocity of 0.25 m/s or travelling backwards due to ship roll.
- BINAVG averaged the data into 1 decibar (dbar) pressure bins starting at 1 dbar with no surface bin. The center value of the first bin was set to equal the bin size. The bin minimum and maximum values were the center value plus or minus half the bin size. Scans with pressure values greater than the minimum and less than or equal to the maximum were averaged. Scans were interpolated so that a data record existed for every decibar. The number of points averaged in each bin was added to the variables listed in the data file.
- DERIVE recomputed salinity and calculated other oceanographic parameters (e.g. density, etc.).

## 5. Post-Cruise Calibrations

Post cruise sensor calibrations were done at Sea-Bird Electronics, Inc. during April 1999. The secondary temperature/conductivity pair T1075/C1387 was selected for final data reduction for all stations. In addition to the SEASOFT processing modules, several programs obtained from the Pacific Marine Environmental Laboratory (PMEL) were used to further reduce the CTD/O<sub>2</sub> data:

- FILLSFC was used to copy the first good value of salinity, potential temperature, oxygen, and oxygen current back to the surface. FILLSFC then back-calculated temperature and conductivity and zeroed  $\text{doxc}/\text{dt}$  of oxygen current for those records.
- DESPIKE1 removed spikes from primary oxygen current and oxygen temperature data, as well as removing spikes from the primary conductivity sensor. Data were linearly interpolated over de-spiked records. Conductivity was back calculated, and sigma-theta and potential temperature were recomputed for the interpolated records.
- DESPIKE2 removed spikes from secondary sensors in the same method as DESPIKE1.
- Package slowdown and reversals due to ship roll can move mixed water in tow in front of the CTD sensors. This mixture can create artificial density inversions and other artifacts. In addition to SEASOFT module LOOPEDIT, the PMEL program DELOOP computed values of density locally referenced between every 1 dbar of pressure to compute  $N^2 = (-g/p)(dp/dz)$  and linearly interpolated measured parameters over those records where  $N^2 \leq -1.0 \times 10^{-5} \text{s}^{-2}$ .
- FILTDOC applied a median filter of width 5 dbar to the time rate of change in oxygen current ( $\text{dox}/\text{dt}$ ).

### 5.1 Conductivity

Conductivity slope and bias, along with a linear pressure term (modified beta), were computed by a least-squares minimization of CTD and bottle conductivity differences. The function minimized was

$$BC - m * CC - b - \beta * CP$$

where  $BC$  is bottle conductivity (S/m),  $CC$  is pre-cruise calibrated CTD conductivity (S/m),  $CP$  is the CTD pressure (dbar),  $m$  is the conductivity slope,  $b$  is the bias (S/m), and  $\beta$  is a linear pressure term (S/m/dbar). The final conductivity (S/m) is

$$m * CC + b + \beta * CP$$

The slope term  $m$  is a linear station dependent fit for the entire cruise. For s/n 1387 a series of fits were made, with each fit eliminating bottle values for locations having a residual between CTD and bottle conductivity greater than three standard deviations. The procedure was repeated with the remaining bottle values until no more bottle values were eliminated.

For s/n 1387, the slope correction range was from 1.0002 to 1.0005, and the bias applied was -.0012. Of the 807 bottles, 80% were retained in the fit with a standard deviation of 0.0004 S/m. The PMEL program CALCTD applied these calibrations.

CTD-bottle conductivity differences were plotted against station number, for up cast data, to show the stability of the calibrated CTD conductivities relative to the bottle conductivities (Figure 2, upper panel). CTD-bottle conductivity differences were also plotted against pressure, for up cast data (Figure 2, lower panel).

After the final CTD conductivity was determined by CALCTD, final salinity values were computed. Salinity values were determined according to the UNESCO 1983 polynomial (Fofonoff and Millard, 1983). The standard deviation of the bottle salinity differences was  $\pm 0.003$ . CTD-bottle salinity differences plotted against station number (Figure 3, upper panel) and pressure (Figure 3, lower panel) are shown.

## 5.2 Temperature

The pre-cruise calibration of T1075 was the mean of two post-cruise calibrations, and was within  $0.05e^{-3}^{\circ}\text{C}$  of the overall drift trajectory over the duration of the cruise, as determined by the calibration history of the sensor. The pressure correction for this sensor was determined by Sea Bird to be zero. However, a bias of  $-0.6e^{-3}^{\circ}\text{C}$  was applied to the temperature data in program CALCTD to account for the effect of viscous heating on SBE 3 sensors. An adjustment of  $-0.6e^{-3}^{\circ}\text{C}$  resulted in errors of no more than  $\pm 0.15e^{-3}^{\circ}\text{C}$  from this effect for the full range of oceanographic temperature and salinity.

## 5.3 Oxygen

Oxygen samples collected during CTD/O<sub>2</sub> profiles were used for post measurement calibration. Due to a potential hysteresis problem with oxygen sensors, the PMEL program OXDWNP replaced up-profile Niskin sample data with corresponding processed down-profile CTD/O<sub>2</sub> data at common pressure levels. Oxygen saturation values were computed according to Benson and Krausse (1984) in units of  $\mu\text{mol/kg}$ .

The algorithm used for converting oxygen sensor current and probe temperature measurements as described by Owens and Millard (1985) required a non-linear least squares regression technique in order to determine the best fit coefficients of the model for oxygen sensor behavior to the water sample observations. The Woods Hole Oceanographic Institution (WHOI) program OXFITMR employed the Numerical Recipe (Press *et al.*, 1986) Fortran routines of MRQMIN, MRQCOF, GAUSSJ, and COVSRT to perform non-linear least squares regressions using the Levenberg-Marquardt method. A Fortran subroutine, FOXY, described the oxygen model with the derivatives of the model with respect to six coefficients in the following order: oxygen current slope, temperature correction, pressure correction, weight, oxygen current bias, and oxygen current lag.

Program OXFITMR read the data for a group of stations. The data were edited to remove imprecise points where values were less than zero or greater than 1.2 times the saturation value. The routine varied the six (or fewer) parameters of the model in such a way as to produce the best least

squares fit between the calibration oxygen values and the computed values. Individual differences between the calibration oxygen values and the computed values (residuals) were then compared with the standard deviation of the residuals. Any residuals exceeding a factor of 2.8 standard deviations were rejected. A factor of 2.8 had a 0.5% chance of rejecting a valid oxygen value for a normally distributed set of residuals. The iterative fitting process was continued until none of the data failed the edit criteria. Coefficients were applied using the AOML program CALIBOXY for plotting in Matlab.

By plotting the oxygen residuals versus station, appropriate station groupings for further refinements of fitting were obtained by looking for abrupt station-to-station changes in the residuals. For each grouping, one set of coefficients was determined by fitting bottles from the entire water column. Pressure correction, weight, and lag coefficients were fixed within a reasonable range from output of full water column group fits. Final coefficients were applied to downcast data using the AOML program CALCTDOX2. An overall correction (3<sup>rd</sup> order polynomial fit) was applied to final oxygen data to bring the standard deviation near the nominal WOCE standard accuracy of 0.5% for discrete oxygen titrations.

CTD-bottle oxygen differences were plotted against station number to show the stability of the calibrated CTD oxygen values relative to bottle oxygen values (Figure 4, upper panel). CTD-bottle oxygen differences were also plotted against pressure to show the fit (Figure 4, lower panel) through the water column. The standard deviation of the oxygen differences was  $\pm 3.09 \mu\text{mol/kg}$ . Oxygen sensor 230531 was selected for final data reduction for stations 001-052 and sensor 130433 was used for stations 053-081. Of the 929 bottles, 95% were retained in the fit and had a standard deviation of  $3.09 \mu\text{mol/kg}$ . Table 2 shows the bottle oxygen values that were not used by the OXFITMR FORTRAN program to calculate the standard deviation.

## 6. Lowered Acoustic Doppler Current Profiler

An RD Instruments 300 kHz Broadband ADCP (SN 207) was mounted in downward-looking mode near the center of the CTD/carousel frame. Velocity profiles were internally recorded during CTD casts, and post-processed using AOML-developed software to create velocity shear profiles. Absolute velocities were calculated by referencing shear profiles using ship drift obtained from P-code global positioning system (GPS) positions obtained at the beginning and end of each cast. The shear profile processing methods were similar to those described in Fischer and Visbeck (1993); see also Wilson (1994) for an analysis of the performance of the 300 kHz broadband ADCP in lowered applications. Significant setup parameters were:

Mode 1  
25, 8 m bins  
1 ping / sec  
1 ping / ensemble  
 $2 \text{ m s}^{-1}$  fixed ambiguity velocity  
Narrow Bandwidth

Velocity data were averaged into 10 m bins for presentation. The first valid bin was at 20 m; values plotted at 10 m and the surface were repeated from 20 m. The deepest bin was approximately 100 m below the maximum cast depth, or within 15 m of the bottom. Depth-averaged errors were estimated to be less than  $1 \text{ cm s}^{-1}$ . Profiles shown were based on all shear profiles derived from up and downcasts. Positions and times listed are midpoints of start-down and at-surface values used in processing. Due to equipment problems during station 057, there is no data available for this cast.

## 7. Expendable Bathythermograph Data

Temperature profiles were measured successfully at 96 stations (Table 3) using type T-7 XBT probes. Locations of XBT drops are show in Figure 5 and are also given in Table 3. The launches are listed in sequential order; probes that failed are not listed. The probes were launched from the stern of the vessel while underway. Deployment procedures included noting the time (Z), location, depth (m),

thermosalinograph temperature ( $^{\circ}$ C) and salinity, and engine intake water temperature ( $^{\circ}$ C). The data were acquired on an AOML supplied SEASIV PC running SEAS4 software. The underway XBT autolauncher was engineered and manufactured at NOAA/AOML in Miami, FL.

The output of the acquired data is in ASCII format. Each file is run through a series of AOML created post-processing programs to produce data containing a header of date, time, latitude, and longitude, as well as column data of depth (m) and temperature ( $^{\circ}$ C). Each XBT file was quality controlled according to standard AOML quality controlled procedures (Daneshzadeh, et al., 1994).

## 8. Final Data Presentation

AOML Matlab program DATAREPORT processed the finalized CTD/O<sub>2</sub> data and computed ITS-90 temperature, ITS-90 potential temperature and dynamic height. The final calibrated data files were used to produce the tables and station profile plots presented in Appendix A for each CTD station. The table on the left is in "standard depths" and its corresponding profile plot is shown on the facing page. Bottle salinity values with an "\*" were not used in the final calibration of conductivity data. Niskin bottle depths are presented on the right side of the profile plot. Bottle salinity and oxygen values are plotted as points in the three smaller plots. LADCP profile plots showing U and V components are presented in Appendix B. The final quality controlled XBT data were used to produce profile plots displayed in Appendix C.

## 9. Acknowledgments

The assistance of Captain Vince Seiler and the crew of the *R/V Seward Johnson* are gratefully acknowledged. Marine Technician Donald Cucciarrà provided high quality oxygen and salinity samples and analysis documentation. The scientific participation from Brazil was extremely helpful in all aspects of the cruise.

This research was carried out [in part] under the auspices of the Cooperative Institute for Marine and Atmospheric Studies (CIMAS), a Joint Institute of the University of Miami and the National Oceanic and Atmospheric Administration (NOAA), cooperative agreement #NA67RJ0149. The National Science Foundation and NOAA provided funding for the North Brazil Current Ring Survey.
